

PHAM VI KHANG

GAME DEVELOPER

☎ 0368-039-216

✉ phamvikhang.it@gmail.com

📍 Tan Phu District, HCMC

PROFILE

Unity Gameplay Developer with 3+ years of experience building scalable, modular, and multiplayer game systems. Strong background in C#, real-time networking, backend integration (Node.js/TypeScript), and data-driven architecture. Experienced in designing core gameplay systems, optimizing performance (WebGL), and implementing real-time multiplayer features.

EDUCATION

Bachelor of Information Technology
Industrial University Of HCMC

2018 - 2022

SKILLS

Languages: C#, TypeScript, JavaScript

Game Engine: Unity (3D/2D), Custom Editor Tools

Architecture: Data-driven design, Factory Pattern, Strategy Pattern, Observer Pattern

Networking: WebSocket, Socket.IO, HTTP APIs, JWT Authentication

Backend: Node.js, Express.js, MongoDB

Database: MongoDB, SQL

Tools: Git, Docker (basic), Google Sheets API, RESTful APIs

Deployment: Render.com, WebGL build pipeline

WORK EXPERIENCE

Company: **EONSR**

Unity Game Developer

Project: **Farming Combat Game**

Jan 2026 - Now

- **Project Description:**

- Farming Game is a 3D farming/life simulation title built with Unity using a data-driven, modular architecture. Players manage their farm by tilling soil, planting crops (crops, trees, bushes), watering, harvesting (single or multi-yield), and clearing debris. The player character features a 24-slot inventory, an energy system, tool management, and progression (XP/Level).

- **Technologies:**

- Unity 2021+, C# 8.0+
- Design patterns: Factory (FarmActionFactory), Strategy (FarmAction variants), Observer (GameEvents)
- Architecture featuring **Dependency Injection + Service Locator (GameServices)**

- **Responsibilities:**

- Architect the modular, data-driven Unity infrastructure (services, dependency injection, asset databases) to keep systems loosely coupled and scalable.
- Implement and maintain the core farming gameplay loop (till, plant, water, harvest, clear) plus FarmGrid validation, combo/buff logic, and action prioritization via FarmActionRunner.
- Build and integrate player subsystems (Inventory, Energy, Tools, Progression, Wallet) with KCC-based movement, click-to-move input, and Synty animation bridging.
- Design and wire up UI/UX components (inventory HUD, energy bar, equip panel) and bind them to observer events for live updates.
- Manage technical documentation (Docs/Summary, Design, Implementation) and roadmap planning for future phases (time system, save/load, economy, NPCs, weather, crafting).
- Ensure code quality and maintainability through design patterns, service registration, and alignment with the project's data-driven architecture

- **Project Description:**

- Server is a real-time multiplayer Werewolf (Mafia) backend that powers a **Unity** client via RESTful and **Socket.IO**. It manages lobby/room flow, role assignment, day/night phases, skills, voting, and persistence in **MongoDB**, following layered architecture with repositories, services, and **core game** managers.
- the Unity client for a multiplayer Werewolf (Ma Sói) game. The project integrates tightly with the MaSói2D server via RESTful and **Socket.IO**, rendering gameplay, role selection, voting, chat, and notification flows in Unity while targeting both PC and WebGL builds. Extensive docs cover Google Sheets–driven data imports, notification UX, and deployment pipelines to ensure designers and engineers can iterate quickly

- **Technologies:**

- **Backend:**

- Runtime: Node.js 18+
- Framework: Express.js
- Language: TypeScript 5.1+
- Database: MongoDB 7.0+
- Real-time Communication: Socket.IO 4.7+
- Authentication: JWT
- Testing & API Validation: Postman Collections

- **Client:**

- Engine & Runtime: Unity 2021.3+, C#, URP, IL2CPP/WebGL
- Build Targets: PC standalone, WebGL (Nginx-deployed)
- Tooling & Pipelines: Google Sheets importers, custom Editor tools, link.xml stripping configs, FileZilla/PuTTY deployment scripts
- Data: CSV-driven role/skill definitions, ScriptableObjects for network config, notification data assets

- **Responsibilities:**

- **Backend:**

- Design and maintain layered architecture (routes/controllers → services → core managers → repositories) and ensure clean separation of concerns
- Implement and evolve core gameplay logic: GameManager, PhaseManager, SkillManager, RoleManager, and individual role/skill behaviors.
- Provide secure authentication (JWT), validation, and room/game management APIs plus WebSocket handlers for real-time events.
- Manage MongoDB schemas, repositories, and data integrity for users, rooms, players, votes, and game states.
- Ensure deployment readiness via Docker/PM2, maintain documentation, testing assets (Postman collections, scripts), and operational monitoring (health checks, logging)

- **Client:**

- Maintain Unity scenes, prefabs, and UI flows for lobby, role selection, in-game phases, notifications, and win/lose states.
 - Implement and test client networking (HTTP + WebSocket) with automatic role-selection broadcasts, voting updates, and realtime chat.
 - Manage data import/export pipelines from Google Sheets (roles, skills, notifications) ensuring designers can update balance/UX quickly.
 - Optimize WebGL builds (code stripping, link.xml, memory fixes) and handle deployment scripts, troubleshooting guides, and hosting workflows
-

Company: **Dzogame**

Unity Game Developer

Project: **20 mini-game slot machines**

Mar 2024 - Dec 2024

- **Project Description:** Developed 20 unique mini-game slot machines with distinct mechanics, themes, and rules. Players spin reels to form winning combinations based on paylines, offering diverse and engaging gameplay experiences.
- **Technologies:** Unity, C#, Server/Client socket
- **Responsibilities:** Integrated localization, language selection, and audio management. Optimized UI and assets for smooth gameplay across platforms. Implemented scene transitions and ensured seamless user experience.

Project: **Parchessi**

Aug 2023 - Mar 2024

- **Project Description:** is a classic board game for 2–4 players, where each player races to move their four pieces from the start to the home area at the center of the board. Players roll dice to determine their moves, capturing opponents' pieces by landing on the same square, while safe zones protect pieces from capture. The first to get all their pieces home wins. The game features strategy, luck, and variations like safe spaces and exact rolls to enter the home.
- **Technologies:** Unity, C#, Server/Client socket
- **Responsibilities:** Integrated game maps into the system, implemented animations based on the game script, managed data transmission to synchronize character behaviors with the game script.

Project: **Monopoly**

Jun 2022 - Aug 2023

- **Project Description:** is a classic board game where players buy, trade, and develop properties to bankrupt opponents. Players roll dice to move around the board, purchasing properties and charging rent. The goal is to acquire all properties in a color group, build houses or hotels, and outlast opponents financially. The game ends when only one player remains solvent.
- **Technologies:** Unity, C#, Server/Client socket
- **Responsibilities:** Integrated game maps into the system, Managed data transmission for real-time interactions, Developed and integrated UI, including the Lobby game screen.

Company: **Gsoft**

Jan 2022 - Jun 2022

Intern Data Engineer

- **Technologies:** SQL server, Oracle Warehouse, Docker, Machine Learning
- **Responsibilities:** Improve the model of Machine Learning, use python programming language, write and improve SQL queries, use Microsoft SQL Server, lean Docker, design ETL logic in Oracle Warehouse Builder
