

Combat System

Rolling a dice: have a chance to flip a positive number, or a negative number. The final power will be calculated bases on the set of rolled number

For example: you rolled 6, -2, 4 and -10, the final result will be $6 - 2 + 4 - 10 = -2$ means you missed the attack and dealt damage to your sanity.

If you roll a negative dice the number will equal to 50% of the coefficient. With the Luck stat you can reduce the percentage. The number of the roll will be rounded down.

There are 5 different types of dice rolling:

Attack: $(\text{player base attack power} + \text{dice}_1 + \text{dice}_2 + \dots + \text{dice}_n) * \text{enemy resistance} + (\text{sanity} - \text{maxSanity})\%$

Guard: $\text{player base guard power} + \text{dice}_1 + \text{dice}_2 + \dots + \text{dice}_n$ (if your result is a negative number it wont affect your sanity but the damage receive will be $(\text{enemy_attack} + \text{abs}(\text{your_guard_roll_result})) / 2$).

Dodge: the same as guard, if you roll higher or equal to enemy attack you wont receive any damage but if you roll lower you will receive $\text{enemy_attack} + \text{abs}(\text{your_dodge_roll_result})$.

Spell use: the same as attack

Run away from battle: one dice, if your roll is lower than the enemy attack, there will be $(\text{Luck} * 2)\%$ to flee with half of the damage received, else you will receive all the damage and fail to flee. Even if you success to flee, your sanity will be reduced and you will receive slight damage.

The map will contain 5 floors (assumes every floor has events, but not all have level up event, player has good equipment and buff)

Floor 1: if player finished all floor 1, the level will be around 10 to 15 (the normal enemies will be around level 5, no elite and the boss is level 10)

Floor 2: harder and yields more experience, after finishing floor 2 the level will be around 25 to 30 (the normal enemies will be around level 20, elites are level 25 and the boss is level 35)

Floor 3: way harder and also yields more experience, the level will be around 40 to 45 (the normal enemies level will be around 35, elites are 45 and the boss is 50)

Floor 4: challenging, the player level will be around 50 to 60 after finishing (the normal enemies level will be 45, elites are 55 and boss is 70)

Floor 5: hardest of all, player will fight the boss with the level of 80.

Enemies will have resistance to various types of damage that could affect the output damage of the player.

Player can also acquire equipment that resists various types of damage.

An action can contain multiple dice.

Player stats

Vitality: Player HP (each point increase player Max HP by 10, the base HP will be 100) (the base stat will be around 3 to 6)

Intelligent: To use healing skill and other magic skill effectively, and also max player's mana (each 3 points of intelligent increases the coefficient by 1, each point of intelligent increase max Mana by 5, base Mana will be 50)

Faith: Player SP (Affect the player's sanity endurance toward sanity attack like enemy charge attack and stuff, and the amount of SP gained through attack on enemies) (the base stat will be around 6 to 9) (each 5 points increase the SP gained by 1 and SP reduction resistance increases by 5%, the base SP gained is 5 and base SP reduction resistance is 0%) (the max sanity will always be 45, which means at 45 sanity player will have 95% chance to roll a positive dice, at -44 is 90% chance to roll a negative dice, and at -45, you die due to going insane).

Strength: Affect attack rolls (each 3 points of strength increases the coefficient by 1, the base stat will be around 9 to 15, at the start player will use the broken sword with the base attack is 5)

Endurance: Affect player defense (each 3 points of endurance increases the coefficient by 1, the base stat will be around 18 to 21)

Dexterity: Affect dodge, run away roll, crit rate and crit damage (each 3 points of dex increases the coefficient by 1, each 5 points increase crit rate by 5%, crit damage by 20%) (base crit rate will be 5%, crit damage is 10%, the base dex will be around 6 to 9 and won't affect the base crit rate and crit damage) (the run base power will be 20) (crit rate capped at 60%, crit damage capped at 100%)

Luck: affect the negative roll (each 5 points of luck will reduce 1% of the percentage, the base stat will be 0 to 3) (can not go below 10%)

When level up, player will gain 3 stat point to upgrade the stats.
